FEDERAL COMMUNICATIONS COMMISSION
OFFICE OF SECRETARY

Re: *Ex Parte* Presentations in ET Dockets Nos. 96-8 (Spread Spectrum)

Dear Mr. Caton:

Today, Dr. Steven H. Goldberg, Vice President and General Manager of the Cylink Wireless Group, and I discussed Cylink's positions in ET Docket No. 96-8 with Dr. Michael Marcus, Assistant Chief of the Office of Engineering and Technology. Copies of the materials distributed at the meeting are attached.

An original and one copy of this notice are provided. Please contact me with any questions involving this matter.

Respectfully,

David E. Hilliard

David E. Hilliard
Counsel for Cylink Corporation

cc: Dr. Michael Marcus

Cylink Corporation
Sunnyvale, California
ET Docket No. 96-8

- **Applications That Need Power Above 6 dBw (4 Watts EIRP)**
 - **Intelligent Transportation Systems (e.g Traffic Light Control, Traffic Sensors, and Toll Collection Back-Haul)**
 - **Internet Connectivity for Schools**
 - **Energy Control**
 - **Telemedicine**
 - **Cellular and PCS Backbone**
 - **Thin Route T-1**
 - **Rural Telcos**
 - **Emergency Restoration**

- **Needs and Applications Can Be Temporary or Long Term. Part 15 Spread Spectrum Point-to-Point Links Can Fill the Gap on Short Notice.**

Ex Parte Presentation
February 11, 1996

Technical Considerations

- **4 Watts EIRP at 2.4 GHz Can Support 5 Mile Links vs. 30 Mile Links Now Usable.**
- **4 Watts EIRP at 5.8 GHz Can Support 7.5 Mile Links vs. 24 Mile Links Now Usable.**
- **Lower Power Means More Sites; Greater Expense, and Greater Environmental Impact.**
- **Higher Power is Needed to Overcome Growing ISM Noise Levels, Particularly at 2.4 Ghz.**
As NTIA has pointed out: "... the dominant [microwave] oven signals can be 30 dB or more stronger than the background aggregate signal level. *For this reason it is important that designers of equipment to be used in the 2400 - 2500 MHZ band consider the effects imposed by those dominant oven sources, especially if the equipment is to be used in a downtown location.*" Measurements to Characterize Aggregate Signal Emissions in the 2400 - 2500 MHZ Frequency Range, NTIA Report 95-323 (Aug. 1995) (Emphasis supplied) at 22. CCIR Studies show measured field strength for ISM devices in the 2450 MHZ band ranging from 60 to 120 dBuV/m at 30 meters from the boundaries of buildings in which the ISM equipment is located. Recommendations of Task Group 1/2 (formerly CCIR IWP 1/4), CCIR Document 1 65 E (14 Dec. 1993) at Table 1.

- **Point-to-Point Non-Consumer Links Have Operated for Nearly 6 Years Without Interference. Some 3000 Cylink transmitters in the U.S. operate in systems with more than 4 watts EIRP without harmful interference.**
- **LANS Are More Likely to Desense Point-to-Point Systems Than Vice Versa.**

Economic Considerations

- **The current waivers to permit antenna gain greater than 6 dB provide not only jobs and technology in the U.S., but support a thriving export business. Cylink systems are also used in 80 countries throughout the world. Foreign policy makers look to the U.S. A change in U.S. policy may affect use in other countries.**

Transition Provisions

- **Transition Provisions Should Foster Flexibility and Accommodate Ongoing Projects.**

Any restrictive requirements that would reduce EIRP from that now permitted under existing waivers should be implemented over at least a 12 month period after new rules are published in the *Federal Register*.

A I R L I N K

T 1 / E 1

AIRLINK

FAST, ROBUST, COST-EFFECTIVE WIRELESS COMMUNICATIONS

CYLINK

Get Connected from Almost Anywhere to Almost Anything...

Running cable from a remote location to a satellite earth station or fiber backbone can be a non-trivial exercise. Often the process raises serious issues of cost and reliability.

But you don't have to face them, because there is a reliable, economical alternative. To get your communications program off the ground and solidly linked to your service provider's network, get airborne with AirLink. AirLink wireless communications provide a simple and inexpensive "last mile" solution.

Cylink antennas easily mount on a roof or mast. AirLink E1/T1 modems can be mounted indoors or outdoors under the antenna. The AirLink E1/T1 has industry-standard interfaces for direct connection to PBXs, multiplexers, routers, bridges, channel banks, and other common communications link components.

Immediately...

If you need service RIGHT NOW, and you can't get a cable in fast enough, get connected with AirLink. You'll be amazed at how quickly — and easily — the AirLink E1/T1 can have you up and running.

With instant, software-controlled configuration.

The AirLink T1/E1 is the first software-controlled spread-spectrum microwave modem. All the configuration is done by the installer on the spot.

To set the RF (radio frequency) output power, the installer just types it. No need to wait for the system to warm up. The software and the hardware ensure that the value typed in is the power transmitted.

To verify the communications link, technicians simply check the number of errored seconds, RF power level being received, the quality of the received signal, the alarm log, and other pertinent parameters without disturbing the T1 or E1 payload. Self test and loopback tests are built in, so the technician doesn't even need to carry test equipment.

Once the local AirLink is running smoothly, what about the far end? No need to travel to the other end

of the link to find out. Just enter the remote commands. The far-end AirLink will respond using the supervisory channel between the radios. Again, this is done without disturbing the payload.

That's the value of software-controlled AirLink radios. It's all so fast and easy.

Spread-spectrum robustness, proven in 10,000 installations worldwide,...

Incorporating spread spectrum technology, Cylink's modem is virtually immune to interference from other modems operating in the Industrial, Scientific & Medical (ISM) frequency bands. It is also inherently private and not detectable by consumer-type scanners.

And it's tough. Hostile environments present no challenge to this box.

In the unlikely event of a failure, a spare AirLink can be installed in minutes. Enter a few software configuration instructions and you're up and running again. There are no circuit boards to move around and no jumpers to set.

With fewer spare units needed to support a large network, Airlink brings the life-cycle cost of ownership of the network down significantly.

Cylink's spread spectrum microwave technology has been proven robust by over 10,000 modems installed around the world. When the going gets tough, the tough take to the airwaves — with AirLink.

Exceeds wireline performance.

When interruptions or noise and bit errors on your wireline service become excessive, have a look at how well AirLink solves your problem.

AirLink modems beat the problems associated with long wire runs and frequent interruptions. Highly reliable service and superior performance come with every AirLink you install.

Interconnect Offices...

Rapid growth is exciting, but the growing pains can be excruciating. Just keeping all those new people in touch with each other is a serious challenge.

The solution is AirLink T1/E1.

When your site starts expanding into a campus and you're having trouble getting communications established in a timely manner, or the phone bill keeps rising just to maintain

interbuilding communications, AirLink microwave radios are your best alternative.

Whether the branch office is across the street, across the river, or over 20 miles (35 km) out of town, if you can see it, AirLink radios can reach it.

Swapping files, forwarding voicemail, video conferencing — it's all part of the capabilities you get with the AirLink T1/E1. Airlink T1 and E1 modems supply respectively 1.5 and 2.0 megabit

full-duplex communication channels between routers, bridges or multiplexers connected to the segments of your LANs (local area networks). The AirLink radios are transparent to the protocols used.

Connect cellular, SMR, PCS, or paging microcells...

AirLink is a natural for a variety of specialized communications needs:

- Minicell and microcell sites carrying a small amount of traffic are best served by a single T1 or E1 trunk with an AirLink radio.
- Two-way paging creates a growing need for many receiver sites that AirLink fills admirably.
- Specialized Mobile Radio (SMR) and personal communications services (PCS) have similar cell sites and usually need only the thin back bone provided by an AirLink modem.

Located on hilltops or building peaks, these sites are often easier to reach by microwave radio than by cable. The AirLink family is the "best-value" solution.

And rural sites.

Many towns, villages, and work sites are too difficult to reach with cable, but easily reached by microwave radio. Place an AirLink T1/E1 in the village, put a repeater on the mountaintop and you have created a full T1 or E1 connection to the city. Now there's cost-effective communications.

Cost-effective communications solutions begin with AirLink wireless networks.

Wireless Communications at 1.544 and 2.048 Mbps with Cylink's AirLink T1 and E1 Microwave Radios

- Get Connected— from Almost Anywhere to Almost Anything...
- Immediately...
- With instant, software-controlled configuration.
- Spread-spectrum robustness, proven in 10,000 installations worldwide,...
- Exceeds wireline performance.
- Interconnect Offices...
- Connect cellular, SMR, PCS or paging microcells...
- and rural sites.

Providing the Connection:

Wireless Data Networks

AirLink systems provide remote connectivity in a wide range of private and public data networks. Systems can be deployed in hub, repeater and endpoint configurations to implement point-to-point or multipoint data networks. Banking networks use AirLink to connect ATM terminals. Point-of-sale and gaming networks consolidate traffic from multiple terminals and use AirLink for transmission to off-site transaction processing centers. Internet service providers are using the wide range of AirLink products to supply connectivity worldwide. AirLink systems enable corporations to build private wireless networks that span anything from parking lots to entire countries. By using digital technologies, these networks can transport data or voice traffic with equal efficiency.

Country-Wide Network Reaches Growers

A large international fruit company recently set up a nationwide network to support farming operations in Latin America. Public carrier circuits were employed as the backbone, but connecting the carrier's points of presence to plantation sites required wireless communications. The company built an entire coast-to-coast corporate data network operating at 64 kbit/s using AirLink systems and Cisco routers. The wireless network pushes just-in-time ordering principles to growers by allowing inventory to be picked as orders are received, barcoded and tracked en route to the customer.

Wireless Replaces Noisy Wiring

Faced with a noisy wiring plant that handles voice but not data, the Costa Rica telephone company established a hilltop hub site with line-of-sight access to businesses in the capital city of San Jose. All of the traffic coming into the site across low-speed links is multiplexed into a single fractional T1 circuit and backhauled over a larger AirLink circuit to the central office. This allows the telephone company to immediately provision valuable customers while the effort to upgrade cable continues at a normal pace.

AirLink™ in Data Communications

Delivering E-mail via the Internet

In Armenia, a strong demand exists to supply Internet connections to the business and academic communities, but the limited telecommunications infrastructure restricts wireline access to e-mail service that the Internet provides. To deliver the service, a network operator built an earth station as a gateway to the Internet. Individual connections to the Internet's e-mail backbone are provided using AirLink systems fanning out from the earth station.

Helping Schools Go Online

U.S. school administrators are being directed to bring their networks on-line with the Internet. But economic policies make it inconvenient for each school to establish a separate Internet connection resulting in multiple repetitive charges. In order to reduce this problem,

- AirLink systems are increasingly used to network schools together to share Internet gateways. This one-time capital outlay is considered more acceptable to school officials than duplicated connection expenses.

Managing Transportation Networks

AirLink systems are adopted and integrated by leading manufacturers of traffic control systems to enable dynamic centralized control of tomorrow's highways.

Synchronized signals:

Federal programs are underway to coordinate traffic signal lights along heavily traveled corridors to reduce idle time. AirLink systems are deployed for permanent or temporary connection to traffic flow measurement devices. Wireless communication is the preferred method to connect devices as it is rapidly deployable and is not vulnerable to interruptions from frequent construction projects.

Intelligent highways:

New highway systems use rush hour cameras and pressure sensitive loops in-road to detect traffic flow, metering lights to control traffic, and overhead electronic displays for real-time traffic information. AirLink systems allow these widely dispersed elements to communicate without digging up roadbeds to lay new communication lines.

Providing the Connection Air

Expanding the Communications Infrastructure

Cylink is helping carriers realize the goal of allowing people to communicate with one another, anytime, anywhere.

Potential telephone customers in many rural areas remain unserved by wire due to capital costs, time to deploy, or physical barriers. Radio-based infrastructures significantly reduce or eliminate such drawbacks. These networks cost far less to install than physical connections and readily circumvent most obstacles while providing more rapid expansion of services. When AirLink systems are deployed for temporary use in the local loop, they can be moved and redeployed to new locations as the copper infrastructure catches up.

AirLink provides facilities for the delivery of telephony in combination with traditional voice equipment such as channel banks, key systems and PBXs. Cylink's wide range of AirLink microwave systems allow scalability from a single line to E1 capacity.

Whether building a private data network, or extending phone service to a remote village, AirLink systems allow network operators to quickly provide service to locations that would otherwise be inaccessible.

WLL (Wireless Local Loop) Connects Remote Villages

The Pakistan Telecom Corporation has a mandate to install thousands of telephone lines to remote villages that have never had service. In order to meet time and quality-of-service provisions in the mandate, they chose AirLink as part of their pay phone system design. AirLink systems can be deployed rapidly to temporarily connect phone sites and then redeployed to more distant locations as the wired network expands to absorb the previous site.

Reaching Business When Limited Wiring Can't

As part of a program to upgrade their infrastructure, the Jamaica Telephone Company recently purchased a modern fiber backbone, a new central office and a state-of-the-art switch. Yet with a limited wiring plant, businesses still experienced difficulty accessing voice services. The solution involved 64 kbit/s AirLink wireless links - each delivering 8 channels of compressed 8 Kbit/s voice - between the remote customers and the central office. The AirLink systems allow Jamaica telephone to reach beyond existing wiring to provide service to new customers.

Link™ in Voice Communications

Providing Cell Interconnect For PCS

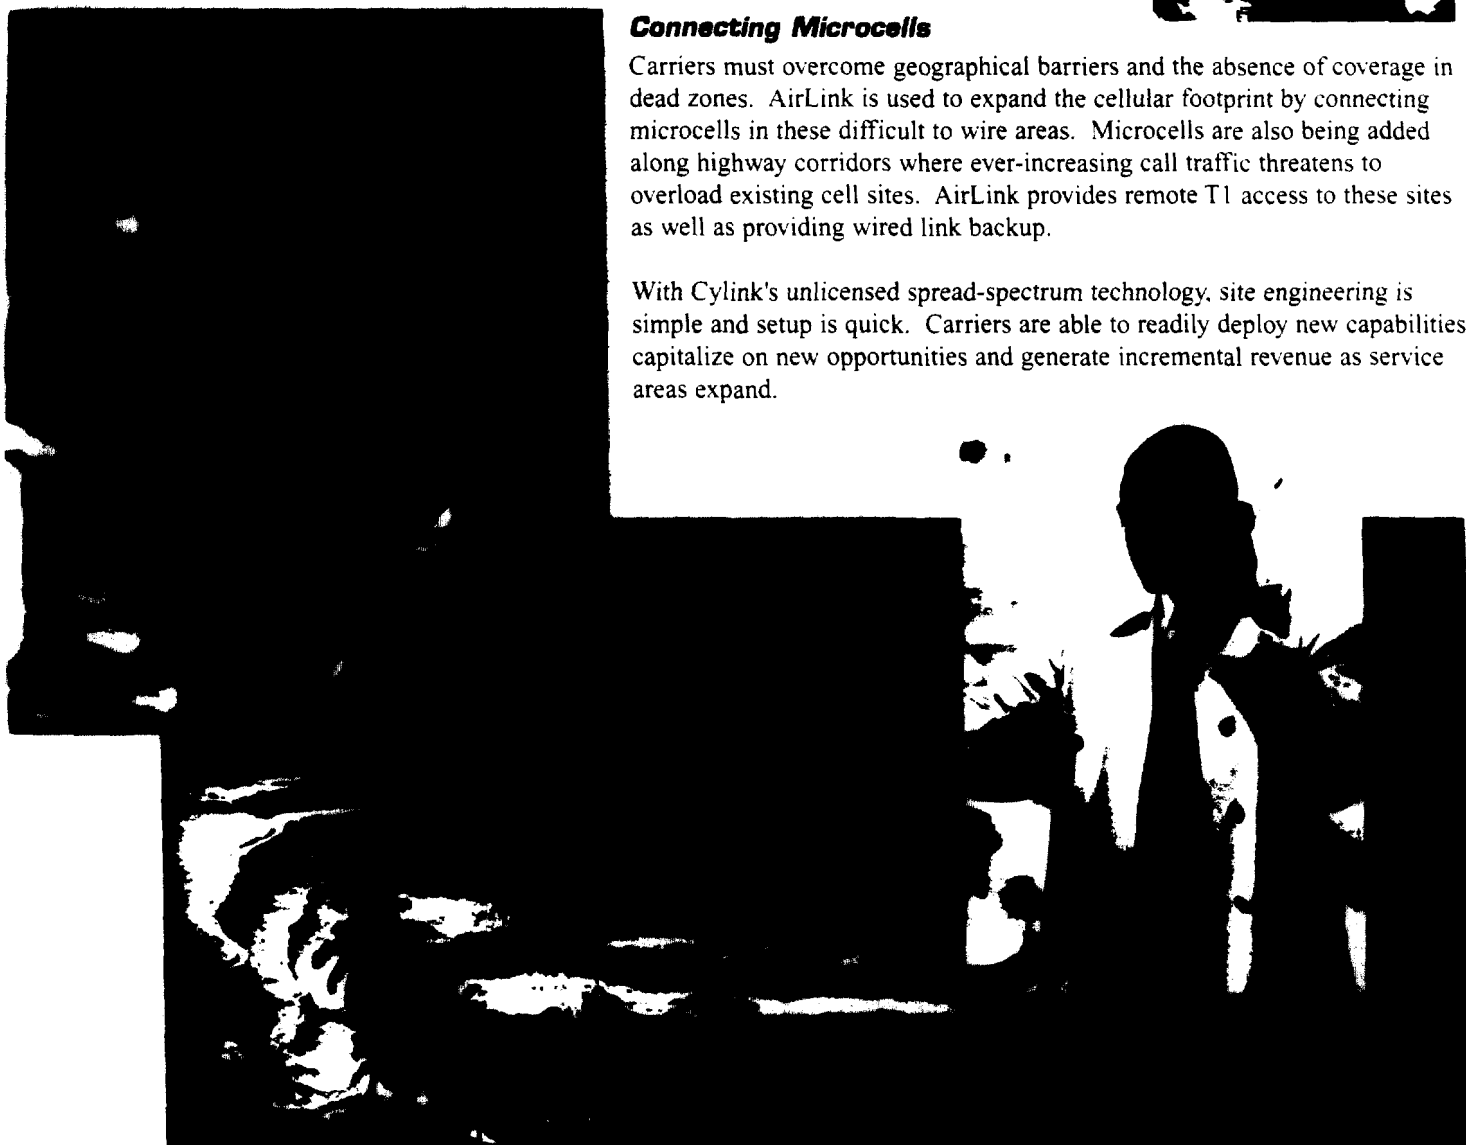

The rapid expansion of PCS (Personal Communication Services) requires construction of thousands of new microcells. The placement of cells is dictated by the area that must be covered, not by the convenience of routing backhaul connections to the site. Because of this, cells have been located on top of power poles, bridges, and other prominent structures. Network builders need to connect these cells to the service provider's point of presence, but many cells are difficult to reach by wire. To offer immediate access, a major PCS supplier in the US selected the AirLink T1. With the delivery of T1 over microwave, AirLink allows connectivity in out-of-the-way locations providing for rapid and cost effective infrastructure expansion.

Connecting Microcells

Carriers must overcome geographical barriers and the absence of coverage in dead zones. AirLink is used to expand the cellular footprint by connecting microcells in these difficult to wire areas. Microcells are also being added along highway corridors where ever-increasing call traffic threatens to overload existing cell sites. AirLink provides remote T1 access to these sites as well as providing wired link backup.

With Cylink's unlicensed spread-spectrum technology, site engineering is simple and setup is quick. Carriers are able to readily deploy new capabilities, capitalize on new opportunities and generate incremental revenue as service areas expand.

COMPLETE NETWORK SECURITY

Cylink Corporation

I n t e r - N e

Started in 1984, Cylink Corporation is the world's leading provider of commercial enterprise-wide information security solutions, and the pioneer of industry-standard public key management technology. In 1990, the company introduced its line of extremely reliable, long-range, digital, spread spectrum microwave radio systems available in a wide variety of data rates. These wireless communications products are ideal for locations where wired connections are impractical. • The company is headquartered in Sunnyvale, California, U.S.A. with sales and service offices in eight countries around the world. Cylink's customers include Fortune 500 companies, multi-national financial institutions, agribusiness, construction, petro-chemical, and numerous U.S. and international government agencies.

A LETTER FROM THE FOUNDERS

"Maintaining our solid leadership position isn't only a reflection of marketshare. In our minds, it's really about the strength of our relationship with Cylink customers. It's about our ability to respond to our customers' needs by providing the highest quality, cutting-edge information security and wireless communications solutions in a global market exploding with commerce and innovation. • When we founded Cylink in the early 1980s, it began as a mission to provide products that filled a critical void in the data security market. Our customers wanted to hop aboard the electronic information and networking bandwagon, but to do so, they had to feel completely secure transmitting their most valuable commodity — information.

A Secure Commitment. It became our commitment to pioneer this path through the development of technology and tools that not only were innovative, reliable, easy-to-use and flexible, but also provided a lasting value and were uncompromisingly secure. It was a great challenge, but we accomplished our objective. In 1984, Cylink, in collaboration with

Peace-of-mind
protection for your most
important investment

With three trillion dollars transferred
electronically each day all over the
world, major banks depend on Cylink
to ensure complete security.

t w o r k i n g

Stanford University, pioneered the commercial implementation of Diffie-Hellman public key management. We also introduced the world's first integration of this public key technology and centralized network management into enterprise-wide information security products for high-speed wide-area network (WAN) security. This enabling technology has become the universal standard for modern network data encryption.

It ensures that an organization's business transactions and communications are always completely secure. • But we didn't stop there.

In 1987, we pioneered the first public key management co-processor which remains the application-specific integrated circuit (ASIC) industry-standard for public key management acceleration. In 1994, we brought to market the first triple-DES (Data Encryption Standard) encryption algorithm ASIC and the first high-speed triple DES encryptor. • The banner year of 1995 resulted in several new products that changed the face of secure enterprise-wide networks forever. We introduced an advanced security library for software developers, a certificate-based access control system, a certificate-based LAN security system, and the world's first asynchronous transfer mode (ATM) cell encryptor.

WIRELESS COMMUNICATIONS

When wires can't get
there, Cylink can.

The Wireless Revolution. While enterprise security solutions are our landmark business, it isn't our only business. Recognizing the developing need for a wireless data and voice communications infrastructure — where phone lines can't go — we introduced our AirLink™ family of wireless, long-range, digital microwave radio products in 1990. By leveraging our existing spread spectrum technology expertise and adding complementary narrowband products, our reputation as a single source, wireless communications provider has grown dramatically. • We continue to listen to our customers and develop new products with the same promise of high quality, reliability and commitment our name has come to represent. It is precisely this distinction that keeps Cylink in the forefront of the global marketplace, and our customers free to do business where and how they want — without limitations and with complete confidence."

— Cylink Founders Lew Morris and Jim Omura

In remote areas where wires cannot go,
AirLink makes communications possible
by providing the last mile solution
with local telephone companies.

Cylink Enterprise Security

The Network Investment is as Protected as the Network

Prior to the 1990s, a business or organization's information was stored in centralized mainframes running along private networks. Security violations were rare. • However, this sense of security unraveled in the 1990s when enterprises began to take advantage of distributed client/server architectures, such as the Internet — a fundamental shift that has facilitated global business transactions. But with these open, distributed, enterprise-wide networks came unscrupulous hackers responsible for breaches amounting to losses in the millions. • This simply was not acceptable.

Security Has No Limits.

Users have always demanded an effective security solution. This solution must encompass the five critical functions of enterprise security: authentication, access, privacy, integrity and non-repudiation.

The solution must integrate easily into existing networks, making migration easy and cost-effective. The approach must be seamless and fully interoperable with applications, nodes and sub-networks under a common administration, and able to run across LANs, WANs and the Internet. It must offer software development tools so organizations can create custom applications to meet their unique requirements. And of course, the best technology must provide complete security, beyond conventional network firewalls and password entry. With all these requirements, how far would a business have to go to protect its most valuable asset — information? • Not far. The secure solution has always been Cylink's family of enterprise-wide information security products.

SecureX25

SecureX25 encrypts from 32 to 512 simultaneous virtual circuits of data rates up to 64 kbps.

SecureWAN

The SecureWAN's high-speed HSI link encryptor for digital networks features the power of DES or Triple-DES encryption.

SecureAccess

SecureTraveler for Windows and SecurePocket Traveler provide access for thousands of remote dial-up users.

"We've got too much to lose if there's a security breach. Our data-sensitive applications travel worldwide over multiple, dedicated circuits. Cylink's encryption with both DES and proprietary regional capabilities gave us the peace-of-mind we've got to have. Security problems are now history."

- Director of MIS,
large worldwide long distance
communications company

"Pharmaceuticals are a competitive business. We needed easy-to-configure products and encryption to secure data links on a worldwide network that passes scientific formulas to various R&D labs. Cylink was the only company able to give us the flexibility, with high and low speed encryption capabilities."

- Vice President, MIS,
multinational pharmaceutical corporation

"We have a lot of remote users — traveling trial attorneys — who must have server access 24 hours a day. The potential for an unauthorized breach is very real with dial-up connections. Now our lawyers worry about the trial; Cylink takes care of security."

- MIS Director, U.S. Department of Justice

Whether communicating through the Internet or via a corporate network, Cylink security products guard your information at both ends of the network.

Leadership by Design.

At the core of Cylink's product design is the Secure Enterprise Architecture — S.E.A.Stack™ — which forms the foundation of Cylink's product families: SecureAccess™ for remote access; SecureLAN™ for enterprise local area network security; and SecureWAN™ for wide area network security. • Using its own integrated circuit technology, Cylink provides state-of-the-art performance and superior reliability. As a result, Cylink's security products don't affect network throughput like many of the traditional security alternatives available today. • Cylink also provides custom algorithms, as well as proprietary ICs, including very high-speed DES and Triple-DES encryption engines, and a specialized co-processor for public key acceleration.

Secure Enterprise Architecture.

Cylink's S.E.A.Stack incorporates the elements required for an all-encompassing enterprise-wide security system: encryption, key management, public-key digital signatures, certificates and certificate-issuing authorities, directory services, comprehensive network security management and security protocols. • This powerful and innovative architecture provides privacy, data integrity, authentication, access control and non-repudiation throughout the network with centralized configuration and control. Cylink's key management and authentication, which is completely automated through public key cryptography techniques, makes scalability previously considered impossible, easy to accomplish. • Cylink's family of enterprise-wide information security products makes the network investment as protected as the network.

SecureLAN

All SecureLAN products are based on hacker-proof certificate and encryption technology at the highest level of

SecureDomain

SecureDomain and SecureNode card allow nodes, domains, subnets and networks to communicate securely and seamlessly.

"We needed a solution that was easy to install, mobile and provided consistent high performance and reliability. Racing officials, drivers and pit crews depended on it. AirLink was the only product that met our requirements."

- **Director of Information,**
U.S. sports car racing organization

"We contracted to help a Pacific Rim government "telco" deregulate to five regional companies ... in only five years! With AirLinks there were no regulatory complications, and installation was fast — requiring no tower — only a three inch mounting pipe. The cost was a fraction of laying wires."

- **President, California-based distributor**

"When corporate demanded better communications, we knew we couldn't afford to lay lines to our scattered farms and zone offices. And wires would be a maintenance nightmare in the jungle terrain. We had to go wireless. We chose AirLinks because of performance and reliability; we chose Cylink because of the local service and support."

- **Regional Manager,**
Latin American fruit grower and processor

Cylink Wireless Communications

Where Wires Won't Go

Meeting the worldwide market demand for improved communications is one of the highest investment priorities for businesses today, whether it's to carry private voice transmissions across town or data communications over a public network. In developing countries, voice and data communications are not always reliable; yet to compete in the global market, updating existing systems to improve performance, handling increasing traffic requirements, or installing new systems where there are none, can be a matter of national survival.

Untethering Communications.

Today, there is a revolution as companies vie for access on leased and dial-up lines to accommodate both routine voice and the exploding trend of

electronic data communications. To fill expanding service requirements and overload, many businesses and telephone companies are now choosing wireless communications as a high-quality, reliable and cost-effective alternative to wired infrastructures. • Cylink offers this alternative with its "spread spectrum" microwave technology which increases reliability and minimizes interference. Spread spectrum differs from other commercial microwave technology because it spreads, rather than concentrates the signal. And since the licensing requirements for wide bandwidth technology, such as spread spectrum, have been removed by the FCC and many other international licensing agencies, Cylink's approach makes wireless communications easier and more cost-effective than ever before.

AirLink Product Family

AirLink wireless modems offer powerful point-to-point or point-to-multi-point systems — often without licenses.

Cylink offers a wide variety of antennas customized to work with the AirLink wireless modems.

A I R L I N K

No matter whether voice and data transmissions must travel over 30 miles of sea swells, wide canyons or busy boulevards, AirLink products provide consistently clear and reliable communications.

The AirLink Virtual Wire.

Cylink's AirLink family of digital microwave radio modems is based on a technology that offers all the advantages of reliable service without the monthly bill or limitations of wires. • The AirLink family of wireless modems — point-to-point/point-to-multi-point, AirLink T1/E1, and the AirLink Bridge — provide a cost-effective alternative to wires with their full-featured, error-free digital pathways and easy installation. Through a powerful over-the-air protocol, many links can be distributed from a hub or base station, making AirLink particularly suitable for local distribution from wired, fiber and satellite networks. And for those applications that have a

full line-of-sight, crisp, clear communications is accomplished up to 30 miles/50 km, and further with the addition of repeaters. • AirLink products are interoperable with all popular communications technology — bridges, routers, multiplexers and phone systems — and completely transparent to the end-user. Its full-duplex operation, combined with a unique interface and other design enhancements, allows customers to plug into AirLink as if they were using a leased wired line provided by the local telephone company.

Cylink Chips

Cylink designs custom ASICs for information security and wireless communications products.

AirLink T1/E1 Radios

Rugged, outdoor design T1/E1 radios are remotely configurable and allow connections and performance to be monitored from the desktop.

AirLink spread spectrum products transmit up to 30 miles and will extend further with repeaters.
